

LANDSLIDE INVESTIGATION & REMEDIATION DESIGN

Landslide investigation and remediation design has been a key NGE specialty since the company's formation. NGE has conducted geotechnical investigations for landslides for a wide variety of clients including transportation agencies, commercial developers and energy companies in West Virginia, Pennsylvania and Ohio.

NGE has highly portable hand-operated soil sampling equipment and track-mounted rotary drilling rigs capable of accessing difficult locations. Our geotechnical laboratory is equipped to determine soil index properties, strength and settlement.

NGE personnel have also provided construction inspection services for landslide repairs and have responded to geotechnical emergencies during construction.

NGE has designed landslide repairs using earth buttresses, retaining walls, reinforced slopes and drainage. Each of our senior geotechnical engineers have over 24 years of experience.
